PROFILE SUMMARY

Computer Science Engineering student with hands-on experience in software and web application development using Java, Python, JavaScript, React, Spring Boot, Flask, and MySQL. Experienced in developing, testing, debugging, and troubleshooting full-stack and AI-driven applications. Strong foundation in programming, OOP, DBMS, DSA, operating systems, computer networks, and problem solving, with experience working across application development and technology projects. Passionate about building reliable software solutions and continuously developing technical and analytical skills.

EDUCATION

Bachelor of Technology (B.Tech) – Computer Science and Engineering

Expected: 2027

CVR College of Engineering, Hyderabad

CGPA: 8.20 / 10

TECHNICAL SKILLS

Languages:	Java, Python, JavaScript, C
Web & Application Development:	React.js, Node.js, HTML5, CSS, Bootstrap, Spring Boot, Flask
Databases:	MySQL, H2, Apache Tomcat
Core:	OOP, DSA, DBMS, Operating Systems, Computer Networks, Software Development
Tools & Platforms:	Git, GitHub, VS Code, Linux, AWS, Google Colab, Power BI
Development Practices:	Problem Solving, Debugging, Testing, Troubleshooting, Agile
Cloud & Infrastructure:	AWS (Cloud Foundations, Cloud Operations), Basic VMware Workstation

PROJECTS

AI Resume Analyzer with ATS Scoring

- Developed a full-stack web application using Java, Spring Boot, React, Vite, and H2 to analyze resumes against job descriptions and generate skill-match scores.
- Designed and implemented application modules for resume parsing, skill analysis, ATS scoring, and result visualization, integrating PDFBox for document processing.
- Integrated the Gemini API to generate tailored mock-interview questions (~8 per session) and prioritized, actionable improvement recommendations, plus a follow-up chat for candidate questions.
- Tested and debugged application workflows, REST APIs, resume processing, and database operations to improve application reliability.
- Saved past analyses to an H2 database so users can track and review earlier scores over time.

Alzheimer's Disease Detection from MRI Brain Scans Using CNN

- Built a deep learning web application that classifies MRI brain scans into four Alzheimer's stages (Non-Demented, Very Mild, Mild, Moderate Demented) using a custom CNN alongside an EfficientNetB0 transfer-learning model.
- Built with Python, TensorFlow/Keras, OpenCV, and Flask; added Grad-CAM heatmaps so each prediction includes a visual explanation rather than just a label.
- Implemented and tested the full pipeline — preprocessing, training/evaluation, and a Flask interface from upload through prediction, heatmap, and results — plus a JSON API for programmatic use.

MedPredict – Disease Prediction System

- Built a full-stack web application that predicts disease risk from patient inputs using machine learning, with Flask for the backend and React.js for the frontend.
- Trained and evaluated Decision Tree, Random Forest, and Logistic Regression models, with the application automatically selecting the best-performing model.
- Displays the final prediction with a confidence score and a simple visualization of results.

CERTIFICATIONS & ACHIEVEMENTS

- AWS Academy Graduate – Cloud Foundations (Trained) | Amazon Web Services Training and Certification
- AWS Academy Graduate – Cloud Operations (Trained) | Amazon Web Services Training and Certification
- NPTEL – Programming in Java (Elite Silver)
- NPTEL – Python for Data Science (Elite Silver)
- RINEX – Web Development Course and Web Internship
- Zscaler Networking Virtual Internship – AICTE EduSkills
- JNCIA-Junos (Junos, Associate) | Juniper Networks
- Red Hat Training: Getting Started with Linux Fundamentals (RH104 – RHA)
